THE HYDROLOGY OF CARSINGTON WATER

Eur Ing Ian Jenkinson
BSc MBA CEng FICE FIMechE MCMI

Institution of MECHANICAL ENGINEERS

The 740-acre Carsington reservoir takes water from the River Derwent in winter months, by pumping through 6½ miles of tunnels and aquaduct. The Ambergate pumping station can raise its water level by 700mm in a single week.

During summer, water is released back into the river to maintain sufficient volumes for abstraction and treatment further downstream.

Ian Jenkinson is a municipal engineering specialist who has worked at every level of local government from trainee technician to Chief Executive. His presentation will draw on papers that he has authored on the Carsington catchment and its management.

He will discuss the factors that determine water levels within the reservoir, the sources of water that are used for filling it, and how it is used.

Wednesday 6th April 2022
commencing at 7:00 pm
